

# Web and interactive production

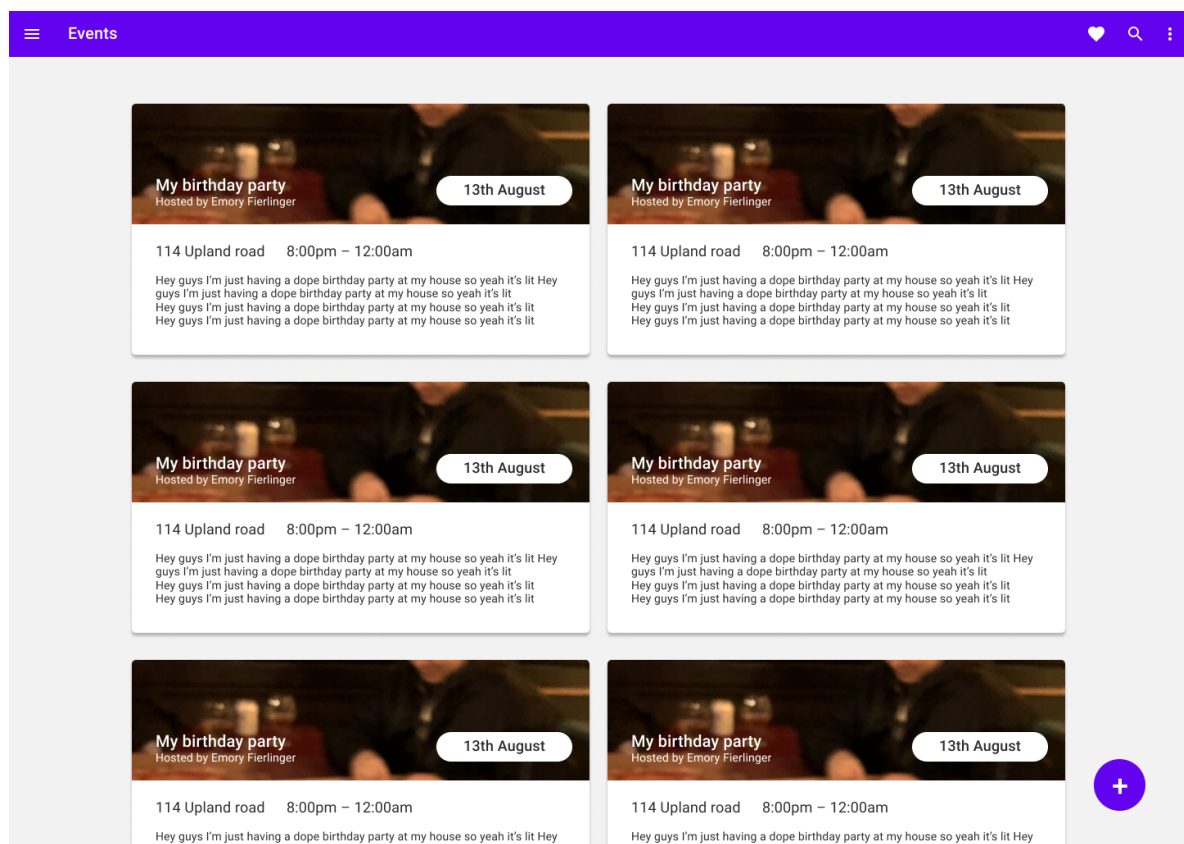

Emory Fierlinger – 18023180

<https://github.com/Emstr/289.212-class>

When Facebook had it's big data scandal with Cambridge Analytica a couple months ago – I thought seriously about leaving the platform. In the end I didn't, and the biggest contributor to me not leaving was missing out on events. Apps like eventbrite and meet up don't have my friends on them. There's no party invites on eventbrite, and hardly any music gigs.

I wanted to build a proof of concept app that could list events for friends. For example parties and music gigs. Obviously it lacks some functionality, like a login system for showing friends who's coming, and private events – but the MVP is there. Keeping the scope simple was vital for this project.

Some early wireframes I did here trying to use the material design style.
